

MOBULOUS TECHNOLOGIES PVT LT.

REACT NATIVE TASK

Requirements:

- Header Section:**
 - Create a visually appealing header with relevant content (e.g., profile picture, username, bio, and other key details).
 - Ensure the header content aligns properly for a clean, professional look.
- Tab Section:**
 - Add **4 distinct tabs** below the header. Each tab should contain different content relevant to the tab's purpose.
 - Example content for each tab:
 - **Tab 1:** Posts or Images Grid
 - **Tab 2:** Videos
 - **Tab 3:** Tagged Items
 - **Tab 4:** About / Contact Information
- Scrolling Behavior:**
 - Make the **entire page scrollable** from top to bottom.
 - Ensure the **tabs remain fixed at the top of the screen** when the user scrolls down (sticky behavior).
 - The content within the tabs should scroll independently beneath the fixed tabs.
- Design Considerations:**
 - Use **modern UI/UX principles** to ensure a professional look and feel.
 - Ensure the layout is **responsive** across different screen sizes (e.g., mobile, tablet, and desktop).
- Performance & Compatibility:**
 - Ensure the design works smoothly with no janky scrolling behavior.
 - Test across multiple browsers/devices to ensure compatibility.

Reference:

Note: Use the **Instagram profile page** as inspiration for layout, tabs, and scroll behavior.

Objective:

Design a screen that displays multiple content cards (containing images, videos, and descriptions) using a scrollable list. The functionality should include **auto-playing videos** based on the scroll position.

Requirements:

- Card Design:**
 - Each **card** should contain the following:
 - **Card Image**
 - **Card Video**
 - **Description** of the card content
- Data Rendering:**
 - Use a **FlatList** (or similar component) to render the cards dynamically.
 - Ensure the data of the cards is passed and displayed properly within each card.
- Scrolling Behavior:**
 - As the user scrolls through the list, the **video inside a card** should automatically **play** when the card reaches **30% of the screen height**.

- Ensure smooth and seamless playback without disrupting the scrolling experience.
4. **Design Considerations:**
 - Use **modern UI/UX patterns** to make the layout visually appealing.
 - Ensure the **performance is optimized** (e.g., by using lazy loading or pausing inactive videos).
 - Implement a **fallback mechanism** to handle videos on low-bandwidth connections.
 5. **Performance & Compatibility:**
 - Ensure the video auto-play feature works smoothly across devices and platforms.
 - Test the design on different screen sizes (mobile, tablet, and desktop) for responsiveness.

Reference:

Use the **YouTube app's feed behavior** as inspiration for video auto-play and scrolling functionality.
